## Adafruit IO FAQ
- Encountering an issue with your Adafruit IO Arduino Project?
Overview

This guide is part of a series of guides that cover the basics of using Adafruit IO. It will show you how to turn a LED on and off from Adafruit IO using any modern web browser.

If you haven't worked your way through the Adafruit IO feed and dashboard basics guides, you should do that before continuing with this guide so you have a basic understanding of Adafruit IO.

- Adafruit IO Basics: Feeds
- Adafruit IO Basics: Dashboards

You should go through the setup guides associated with your selected set of hardware, and make sure you have internet connectivity with the device before continuing. The following links will take you to the guides for your selected platform.

- Adafruit Feather HUZZAH ESP8266 Setup Guide

If you have gone through all of the prerequisites for your selected hardware, you are now ready to move on to the Adafruit IO setup steps that are common between all of the hardware choices for this project. Let's get started!

Get Started with Adafruit IO

Adafruit IO is integrated with your adafruit.com account so you don't need to create yet another online account! You need an Adafruit account to use Adafruit IO because
we want to make sure the data you upload is available to only you (unless you decide to publish your data).

I have an Adafruit.com Account already

If you already have an Adafruit account, then you already have access to Adafruit IO. It doesn't matter how you signed up, your account will make all three available.

To access Adafruit IO, simply visit [https://io.adafruit.com](https://io.adafruit.com) to start streaming, logging, and interacting with your data.

Create an Adafruit Account (for Adafruit IO)

An Adafruit account makes Adafruit content and services available to you in one place. Your account provides access to the [Adafruit shop](https://store.adafruit.com), the [Adafruit Learning System](https://learn.adafruit.com), and [Adafruit IO](https://io.adafruit.com). This means only one account, one username, and one password are necessary to engage with the content and services that Adafruit offers.

If you do not have an Adafruit account, signing up for a new Adafruit account only takes a couple of steps.

Begin by visiting [https://accounts.adafruit.com](https://accounts.adafruit.com).

Click the Sign Up button under the "Need An Adafruit Account?" title, below the Sign In section.
This will take you to the Sign Up page.

Fill in the requested information, and click the Create Account button.

SIGN UP
The best way to shop with Adafruit is to create an account which allows you to shop faster, track the status of your current orders, review your previous orders and take advantage of our other member benefits.

This takes you to your Adafruit Account home page. From here, you can access all the features of your account.
You can also access the Adafruit content and services right from this page. Along the top of the page, you'll see a series of links beginning with "Shop". To access any of these, simply click the link.

For example, to begin working with Adafruit IO, click the IO link to the right of the rest of the links. This is the same for the other links as well.

That's all there is to creating a new Adafruit account, and navigating to Adafruit IO.

Arduino Wiring

You will need the following parts for this tutorial:

- 1x Adafruit IO compatible Feather
- 2x jumper wires
- 1x 560 ohm resistor
- 1x 10mm LED
You will need to connect the following pins to the LED and resistor:

- Feather GND to LED cathode (short leg)
- Feather Pin 5 to one leg of the 560 ohm resistor
- LED anode (long leg) to the second leg of the 560 ohm resistor

Note: Resistors are not polarized, so the 560 ohm resistor can be connected to the circuit in either direction.

Next, we're going to set up our Arduino.

**Arduino Setup**

You should go through the setup guides associated with your selected set of hardware, and make sure you have internet connectivity with the device before continuing. The following links will take you to the guides for your selected platform.

- [Adafruit Feather HUZZAH ESP8266 Setup Guide](#)

You will need to make sure you have at least version 2.3.1 of the Adafruit IO Arduino library installed before continuing.
For this example you will need to open the adafruitio_07_digital_out example in the Adafruit IO Arduino library.

Next, we will look at the network configuration options in the sketch.

### Arduino Network Config

To configure the network settings, click on the config.h tab in the sketch. You will need to set your Adafruit IO username in the IO_USERNAME define, and your Adafruit IO key in the IO_KEY define.

```cpp
#define IO_USERNAME "uniontownlabs"
#define IO_KEY "xxwxxxxxxxxxxxxx"
```

### WiFi Config

WiFi is enabled by default in config.h so if you are using one of the supported WiFi boards, you will only need to modify the WIFI_SSID and WIFI_PASS options in the config.h tab.
FONA Config

If you wish to use the FONA 32u4 Feather to connect to Adafruit IO, you will need to first comment out the WiFi support in config.h

```c
#include "AdafruitIO_WIFI.h"
AdafruitIO_WiFi io(IO_USERNAME, IO_KEY, WIFISSID, WIFI_PASS);
```

Next, remove the comments from both of the FONA config lines in the FONA section of config.h to enable FONA support.

```c
#define WIFI_SSID "Test WiFi"
#define WIFI_PASS "my wifi password"
```

Ethernet Config

If you wish to use the Ethernet Wing to connect to Adafruit IO, you will need to first comment out the WiFi support in config.h

```c
#include "AdafruitIO_FONA.h"
AdafruitIO_FONA io(IO_USERNAME, IO_KEY);
```
Next, remove the comments from both of the Ethernet config lines in the Ethernet section of config.h to enable Ethernet Wing support.

Next, we will look at how the example sketch works.

**Arduino Code**

The `adafruitio_07_digital_out` example uses digital pin 5 by default on all boards, and that can be modified by changing the LED_PIN define.

Note: If you are using the WICED Feather, you will need to change the LED_PIN define to PC5 instead of the default setting of 5.

```cpp
#include <AdafruitIO.h>

// digital pin 5
#define LED_PIN 5

// set up the 'digital' feed
AdafruitIO_Feed *digital = io.feed("digital");
```

In the setup function, we set the LED_PIN as a digital output, and connect to Adafruit IO. We also attach a function called `handleMessage` to the digital feed that will be called whenever your device receives messages for that feed.
The code will wait until you have a valid connection to Adafruit IO before continuing with the sketch. If you have any issues connecting, check config.h for any typos in your username or key.

```cpp
void setup() {
    // set led pin as a digital output
    pinMode(LED_PIN, OUTPUT);

    // start the serial connection
    Serial.begin(115200);

    // wait for serial monitor to open
    while(! Serial);

    // connect to io.adafruit.com
    Serial.print("Connecting to Adafruit IO");
    io.connect();

    // set up a message handler for the 'digital' feed.
    // the handleMessage function (defined below)
    // will be called whenever a message is
    // received from adafruit io.
    digital-&gt;onMessage(handleMessage);

    // wait for a connection
    while(io.status() &lt; AIO_CONNECTED) {
        Serial.print(".");
        Serial.print(".");
        delay(500);
    }

    // we are connected
    Serial.println();
    Serial.println(io.statusText());
    digital-&gt;get();
}
```

Next, we have the main `loop()` function. The first line of the loop function calls `io.run();` this line will need to be present at the top of your loop in every sketch. It helps keep your device connected to Adafruit IO, and processes any incoming data.

```cpp
void loop() {
    // io.run(); is required for all sketches.
    // it should always be present at the top of your loop
    // function. it keeps the client connected to
    // io.adafruit.com, and processes any incoming data.
    io.run();
}
```

The final chunk of code is the handleMessage function. This is the function that is called whenever the digital feed gets a message.

We use the `data-&gt;toPinLevel()` function to convert the incoming data to either LOW or HIGH, and set the state of the LED_PIN to that value.
void handleMessage(AdafruitIO_Data *data) {
    Serial.print("received \&lt;- ");
    if(data-&gt;toPinLevel() == HIGH) {
        Serial.println("HIGH");
    } else {
        Serial.println("LOW");
    }
    // write the current state to the led
    digitalWrite(LED_PIN, data-&gt;toPinLevel());
}

Upload the sketch to your board, and open the Arduino Serial Monitor. Your board should now connect to Adafruit IO.

Connecting to Adafruit IO....
Adafruit IO connected.

Toggle the button on your Adafruit IO dashboard, and you should see the following in the Arduino Serial Monitor.

```
received &lt;- HIGH
received &lt;- LOW
received &lt;- HIGH
received &lt;- LOW
```

You can now toggle the button on your Adafruit IO dashboard, and you should see your LED turn on and off.

---

**Python Wiring**

We're going to use a combination of the Adafruit IO Client Library and Adafruit's CircuitPython to control a Raspberry Pi over Adafruit IO.

**Parts**

1 x Raspberry Pi 3 - Model B+ [https://www.adafruit.com/product/3775](https://www.adafruit.com/product/3775)

The Raspberry Pi is a small linux board compatible with Adafruit IO projects.
If you’re following along with a Raspberry Pi, we use the T-Cobbler Plus for the IO Basics Projects. This add-on prototyping board lets you easily connect a Raspberry Pi (Raspberry Pi Model Zero, A+, B+, Pi 2, Pi 3) to a solderless breadboard:

1 x Assembled Pi T-Cobbler Plus
GPIO Breakout - Pi A+, B+, Pi 2, Pi 3, Zero
https://www.adafruit.com/product/2028

1 x Green LED
Diffused Green 5mm LED
https://www.adafruit.com/product/298

1 x Jumper Wires
Breadboarding wire bundle.
https://www.adafruit.com/product/153

Wiring

You'll need to make the following connections:

- Pi GND to LED Cathode (short LED leg).
- Pi Pin 5 to one leg of the 560 ohm resistor.
- LED Anode (long LED leg) to the other leg of the 560 ohm resistor.

  ◦ note: resistors are not polarized, so the 560 ohm resistor can be connected to the circuit in either direction.

Python Setup

If you’re following along with a Raspberry Pi, Beaglebone or any other supported small linux computer, we’ll use a special library called adafruit_blinka () (named after
Blinka, the CircuitPython mascot () to provide the layer that translates the CircuitPython hardware API to whatever library the Linux board provides. It's CircuitPython, on Pi!

Update your Pi and Python

The latest Raspbian (currently this is `Stretch`) is required for the installation of Adafruit IO + Blinka.

In this page we'll assume you've already gotten your Raspberry Pi up and running and can log into the command line.

Go ahead and ssh into your Raspberry Pi via terminal or a ssh client:

```bash
ssh pi@raspberrypi.local
```

Run the standard updates:

```bash
sudo apt-get update
```

```bash
sudo apt-get upgrade
```

and

```bash
sudo pip3 install --upgrade setuptools
```
Make sure you're using Python 3!

The default python on your computer may not be python 3. Python 2 is officially discontinued and all our libraries are Python 3 only.

We'll be using `python3` and `pip3` in our commands, use those versions of python and pip to make sure you're using 3 and not 2

Install Python Libraries

Installing Adafruit Blinka Library

Now you're ready to install all the python support

Run the following command to install the Raspberry PI GPIO library:

```
pip3 install RPI.GPIO
```

Run the following command to install adafruit_blinka

```
pip3 install adafruit-blinka
```

The computer will install a few different libraries such as `adafruit-pureio` (our ioctl-only i2c library), `spidev` (for SPI interfacing), `Adafruit-GPIO` (for detecting your board) and of course `adafruit-blinka`
Installing Adafruit IO Python Library

We'll also need to install the Adafruit IO Python Client Library to communicate with Adafruit IO.

Run the following command to install the Adafruit IO Client for Python:

```
pip3 install adafruit-io
```

If the installation gives you 'insufficient permissions' errors, add 'sudo' before the call to pip3

Downloading Example Code

The example code is contained within the Python IO Client's examples/basics subdirectory.

Navigate to the root directory of your Pi:

```
cd ~
```

Then, download the latest version of the adafruit/io-client-python repository by running:

```
git clone https://github.com/adafruit/io-client-python.git
```

Navigate to that folder's example folder for the examples:

```
cd io-client-python/examples/basics/
```

That's it! We're all set up.
Next, let's upload some code and learn how it works.

## Python Code

Before we run the script, we'll need to change `ADAFRUIT_IO_USERNAME` and `ADAFRUIT_IO_KEY` to the username and key for your Adafruit IO account.

- If you need the AIO Key, navigate to [your Adafruit IO Profile](https://accounts.adafruit.com)

```python
# Set to your Adafruit IO key.
# Remember, your key is a secret,
# so make sure not to publish it when you publish this code!
ADAFRUIT_IO_KEY = 'YOUR_AIO_KEY'

# Set to your Adafruit IO username.
# (go to https://accounts.adafruit.com to find your username)
ADAFRUIT_IO_USERNAME = 'YOUR_AIO_USERNAME'
```

Next, we'll create an instance of the Adafruit IO Client and set up the feed we created earlier.

```python
aio = Client(ADAFRUIT_IO_USERNAME, ADAFRUIT_IO_KEY)
digital = aio.feeds('digital')
```

The next chunk of code sets up the LED to digital pin 5 (`board.D5`) and sets the direction of the LED to an output.

```python
# led set up
led = digitalio.DigitalInOut(board.D5)
led.direction = digitalio.Direction.OUTPUT
```

To set up the led, assign it to digital pin 5:

```python
led = digitalio.DigitalInOut(board.D5)
```

We want the LED to light up. To do this, its pin needs to be set to an output:

```python
led.direction = Direction.OUTPUT
```

Inside the `while True` loop, the code retrieves the current value of the feed and sets the LED to the value.

```python
while True:
    data = aio.receive(digital.key)
    if int(data.value) == 1:
```
```python
print('received &lt;- ON\n')
elif int(data.value) == 0:
    print('received &lt;- OFF\n')

# set the LED to the feed value
led.value = int(data.value)
# timeout so we dont flood adafruit-io with requests
time.sleep(0.5)
```

## Running the Code

Make sure you're within the `/io-client-python/examples/basics` directory.

If you're not sure which directory you're in, you can check this by running `pwd` and you should see the following output from your terminal:

```
~/io-client-python/examples/basics
```

Let's run the script. In your terminal, run:

```
python3 digital_in.py
```

Toggle the button on your Adafruit IO dashboard, and you should see the following in the terminal of your Pi.

![Image of Adafruit IO dashboard](image)

You can now toggle the button on your Adafruit IO dashboard, and you should see your LED turn on and off.
'digital_out.py'

Example of turning on and off a LED from the Adafruit IO Python Client

Author(s): Brent Rubell, Todd Treece

# Import standard python modules
import time

# import Adafruit Blinka
import digitalio
import board

# import Adafruit IO REST client.
from Adafruit_IO import Client, Feed, RequestError

# Set to your Adafruit IO key.
# Remember, your key is a secret,
# so make sure not to publish it when you publish this code!
ADAFRUIT_IO_KEY = 'YOUR_AIO_KEY'

# Set to your Adafruit IO username.
# (go to https://accounts.adafruit.com to find your username)
ADAFRUIT_IO_USERNAME = 'YOUR_AIO_USERNAME'

# Create an instance of the REST client.
aio = Client(ADAFRUIT_IO_USERNAME, ADAFRUIT_IO_KEY)

try: # if we have a 'digital' feed
digital = aio.feeds('digital')
except RequestError: # create a digital feed
    feed = Feed(name="digital")
    digital = aio.create_feed(feed)

# led set up
led = digitalio.DigitalInOut(board.D5)
led.direction = digitalio.Direction.OUTPUT

while True:
    data = aio.receive(digital.key)
    if int(data.value) == 1:
        print('received <- ON
    elif int(data.value) == 0:
        print('received <- OFF

    # set the LED to the feed value
    led.value = int(data.value)
    # timeout so we dont flood adafruit-io with requests
time.sleep(0.5)
Adafruit IO FAQ

Encountering an issue with your Adafruit IO Arduino Project?

If you're having an issue compiling, connecting, or troubleshooting your project, check this page first.

Don't see your issue? [Post up on the Adafruit IO Forum with your issue](https://community.adafruit.com/).  

I encounter the following error when compiling my sketch:

```plaintext
fatal error: Adafruit_MQTT.h: No such file or directory, #include "Adafruit_MQTT.h"
```

The Adafruit IO Arduino library is dependent on our Adafruit IO MQTT Library.

To resolve this error, from the Arduino IDE, navigate to the Manage Libraries... option in the Sketch -> Include Library menu.

To resolve this error, from the Arduino IDE, navigate to the Manage Libraries... option in the Sketch -> Include Library menu.
My Serial Monitor prints "..." endlessly after the "Connecting to Adafruit IO" message

Your board is not connecting to Adafruit IO, but why? Let's find out:

First, check in `config.h` that you have the correct `IO_USERNAME`, `IO_KEY`, `WIFI_SSID`, and `WIFI_PASS` are set correctly.

Next, we're going to modify the while loop which waits for an IO connection in your sketch. Change the line in the status check loop from `Serial.println(.);` to `Serial.println(io.statusText());`

```cpp
// wait for a connection
while(io.status() < AIO_CONNECTED) {
  Serial.println(io.statusText());
  delay(500);
}
```

Verify and re-upload the sketch. If you're receiving a Network disconnected error message, the board is not able to talk to the internet. Re-check your hardware, connections, and router settings.

If it's still not showing Adafruit IO connected, check the IO status on the Adafruit Status page () to make sure the service is online.

---

My data isn't displaying, is Adafruit IO's {service/MQTT/API} down?

Possibly - you can check IO status on the Adafruit Status page ()

---

Is my data being sent properly? Am I sending too much data?

There's a monitor page built-into Adafruit IO () which provides a live view of incoming data and error messages. Keep this page open while you send data to your Adafruit IO devices to monitor data and errors.
