Overview

You can build your own devices that act like remote keyboards and HID devices for nearly any mobile device or computer with Bluetooth LE and the Adafruit HID library in CircuitPython!

Traditionally, the USB HID library has been used to send keyboard and mouse commands over a USB cable to a computer or mobile device. Now, you can cut that wire and do all the same things using BLE wirelessly!

This tutorial will show one of the many exciting projects you can build with these techniques.

You'll build a wireless volume knob that can turn your sound up and down, mute, and press the play/pause button from across the room to control your mobile device or computer sound!

Plus, we've added Bluetooth LE bonding support, so once you pair your devices, they'll automatically reconnect whenever you turn on the devices.

Parts

Circuit Playground Bluefruit - Bluetooth Low Energy
Circuit Playground Bluefruit is our third board in the Circuit Playground series, another step towards a perfect introduction to electronics and programming. We've... [Link to product page]
Rotary Encoder + Extras
This rotary encoder is the best of the best, it's a high-quality 24-pulse encoder, with detents and a nice feel. It is panel mountable for placement in a box, or you can plug it...

Understanding BLE

BLE Basics

To understand how we communicate between the MagicLight Bulb and the Circuit Playground Bluefruit (CPB), it's first important to get an overview of how Bluetooth Low Energy (BLE) works in general.

The nRF52840 chip on the CPB uses Bluetooth Low Energy, or BLE. BLE is a wireless communication protocol used by many devices, including mobile devices. You can communicate between your CPB and peripherals such as the Magic Light, mobile devices, and even other CPB boards!

There are a few terms and concepts commonly used in BLE with which you may want to familiarize yourself. This will help you understand what your code is doing when you're using CircuitPython and BLE.

Two major concepts to know about are the two modes of BLE devices:

- Broadcasting mode (also called GAP for Generic Access Profile)
- Connected device mode (also called GATT for Generic ATTribute Profile).

GAP mode deals with broadcasting peripheral advertisements, such as "I'm a device named LEDBlue-19592CBC", as well as advertising information necessary to establish a dedicated device connection if desired. The peripheral may also be advertising available services.

GATT mode deals with communications and attribute transfer between two devices once they are connected, such as between a heart monitor and a phone, or between your CPB and the Magic Light.
Bluetooth LE Terms

GAP Mode

Device Roles:

- Peripheral - The low-power device that broadcasts advertisements. Examples of peripherals include: heart rate monitor, smart watch, fitness tracker, iBeacon, and the Magic Light. The CPB can also work as a peripheral.
- Central - The host "computer" that observes advertisements being broadcast by the Peripherals. This is often a mobile device such as a phone, tablet, desktop or laptop, but the CPB can also act as a central (which it will in this project).

Terms:

- Advertising - Information sent by the peripheral before a dedicated connection has been established. All nearby Centrals can observe these advertisements. When a peripheral device advertises, it may be transmitting the name of the device, describing its capabilities, and/or some other piece of data. Central can look for advertising peripherals to connect to, and use that information to determine each peripheral's capabilities (or Services offered, more on that below).
GATT Mode

Device Roles:

- **Server** - In connected mode, a device may take on a new role as a Server, providing a Service available to clients. It can now send and receive data packets as requested by the Client device to which it now has a connection.
- **Client** - In connected mode, a device may also take on a new role as Client that can send requests to one or more of a Server's available Services to send and receive data packets.

**NOTE:** A device in GATT mode can take on the role of both Server and Client while connected to another device.

Terms:

- **Profile** - A pre-defined collection of Services that a BLE device can provide. For example, the Heart Rate Profile, or the Cycling Sensor (bike computer) Profile. These Profiles are defined by the Bluetooth Special Interest Group (SIG). For devices that don’t fit into one of the pre-defined Profiles, the manufacturer creates their own Profile. For example, there is not a "Smart Bulb" profile, so the Magic Light manufacturer has created their own unique one.
- **Service** - A function the Server provides. For example, a heart rate monitor armband may have separate Services for Device Information, Battery Service, and Heart Rate itself. Each Service is comprised of collections of information called Characteristics. In the case of the Heart Rate Service, the two Characteristics are Heart Rate Measurement and Body Sensor Location. The peripheral advertises its services.
- **Characteristic** - A Characteristic is a container for the value, or attribute, of a piece of data along with any associated metadata, such as a human-readable name. A characteristic may be readable, writable, or both. For example, the Heart Rate Measurement Characteristic can be served up to the Client device and will report the heart rate measurement as a number, as well as the unit string "bpm" for beats-per-minute. The Magic Light Server has a Characteristic for the RGB value of the bulb which can be written to by the Central to change the color. Characteristics each have a Universal Unique Identifier (UUID) which is a 16-bit or 128-bit ID.
- **Packet** - Data transmitted by a device. BLE devices and host computers transmit and receive data in small bursts called packets.
CircuitPython on Circuit Playground Bluefruit

Install or Update CircuitPython

Follow this quick step-by-step to install or update CircuitPython on your Circuit Playground Bluefruit.

Download the latest version of CircuitPython for this board via circuitpython.org

Click the link above and download the latest UF2 file

Download and save it to your Desktop (or wherever is handy)
Plug your Circuit Playground Bluefruit into your computer using a known-good data-capable USB cable.

A lot of people end up using charge-only USB cables and it is very frustrating! So make sure you have a USB cable you know is good for data sync.

Double-click the small Reset button in the middle of the CPB (indicated by the red arrow in the image). The ten NeoPixel LEDs will all turn red, and then will all turn green. If they turn all red and stay red, check the USB cable, try another USB port, etc. The little red LED next to the USB connector will pulse red - this is ok!

If double-clicking doesn't work the first time, try again. Sometimes it can take a few tries to get the rhythm right!

(If double-clicking doesn't do it, try a single-click!)
You will see a new disk drive appear called CPLAYBTBOOT.

Drag the adafruit_circuitpython_etc.uf2 file to CPLAYBTBOOT.

The LEDs will turn red. Then, the CPLAYBTBOOT drive will disappear and a new disk drive called CIRCUITPY will appear.

That's it, you're done! :)

Code the BLE Volume Knob

Once your CPB is set up with CircuitPython, you'll also need to add some libraries. Follow this page for info on how to download and add libraries to your CPB.

From the library bundle you downloaded in that guide page, transfer the following libraries onto the CPB board's /lib directory:

- adafruit_ble
- adafruit_hid
- neopixel

Text Editor

Adafruit recommends using the Mu editor for using your CircuitPython code with the Circuit Playground Bluefruit boards. You can get more info in this guide.

Alternatively, you can use any text editor that saves files.

Code.py

Copy the code below and paste it into Mu. Then, save it to your CPB as code.py.

```python

    time.sleep(0.05)

**Code Explainer**

Here are the main things our code does:

- Loading libraries for time, digitalio, rotaryio, neopixel, hid consumer control (media buttons), and adafruit BLE
- Advertising that it is a BLE device that can be connected to
- setting up the button A on the CPB and rotary encoder for reading
- lighting up the NeoPixels yellow until there's a connection made
• lighting the NeoPixels cyan, with one brighter NeoPixel to represent relative volume position
• lighting the NeoPixels red when the push encoder is pressed to mute the volume

Pairing and Bonding

One of the more advanced features used in this project is BLE bonding.

When the Central (your mobile device or computer) connects with the Peripheral (the CPB), you will be asked on the mobile device or computer if you want to Pair with the CPB. Once you agree to pair, a bonding process takes place.

During bonding, encrypted keys are exchanged between the two devices and saved away for use the next time the devices attempt to connect. Since they are bonded, the two will connect automatically without asking for a pairing confirmation. This is really convenient, because it means you can walk one of the devices out of range, thus dropping the connection, and when you return, the two devices will re-connect as if nothing ever happened!

Now, let's build the volume knob!

Beyond the Code

Want to try some variations on the code? A user pointed out:

Maybe this should use the Circuit Playground to simplify accessing the button: https://learn.adafruit.com/circuitpython-made-easy-on-circuit-playground-express/circuit-playground-express-library

Maybe this could use the Debouncing library: https://learn.adafruit.com/debouncer-library-python-circuitpython-buttons-sensors/overview
Build and Use the BLE Volume Knob

Here we'll build a simple-yet-powerful volume knob using a rotary encoder and Circuit Playground Bluefruit.
Build on Breadboard

Following the schematic above, plug the rotary encoder into the breadboard, and then connect the alligator clip wires between the encoder pins and the CPB.

The encoder is essentially two components in one -- the three lower pins are for measuring the knob rotational position, while the two upper pins are for the push switch when the knob is pressed down.

This is the wiring connection list:

- Encoder A pin to CPB A3
- Encoder GND to CPB GND
- Encoder B pin to CPB A2
- Switch ground to CPB GND
- Switch button to CPB A1
Pair (and Bond)

Now you can power up the device with a battery (or USB power) and it will begin to advertise and turn the NeoPixel ring yellow.

On your mobile device or computer with BLE, pick the device (the first time you connect it may have a nondescript name, or the name Bluefruit Volume Control as seen here on an iPad), and agree to the Pairing prompt.

The devices will be paired, and automatically bonded so they can auto reconnect later.
Remote Control
Once connected, the NeoPixel ring will turn cyan. Rotate the knob to raise and lower the volume. Neat huh?! You'll see the bright pixel rotating around along with the knob.

Now, press the push encoder knob down to mute, and the NeoPixels turn red. You can unmute by pressing the button again, or by turning the volume knob.

You can also use the button A on the CPB to toggle Play/Pause.
Fancy Version

If you like, you can build a more permanent version using a Perma-Proto Gizmo.
First, remove the side mounting legs from the encoder using some diagonal cutters. We don't have mounting holes for them, and they aren't part of the circuit, they are just for mechanical stability.

Insert the encoder in the board as shown.

Be sure to remove the twelve amber Kapton stickers from the standoffs, otherwise there won't be an electrical connection to the CPB when we screw them together.
Using short lengths of hookup wire, solder the connections as shown in the schematic drawing below.
You can run all of the wiring on the underside of the Gizmo if you like, for a neater appearance.

Trim all of the excess pin and wire lengths with diagonal side cutters.
Battery

Place the battery between the two boards, and then screw them together with the provided M3 mounting screws.
Plug in the power, pair the CPB with your mobile device or computer with BLE, and you can use your volume knob in style!
