Overview

Having a bad day? With the press of a button and your small desktop storage container erupts into flames, creating a perfect visual representation of how life often feels, and a cathartic way to express oneself.

How it Works

A servo motor opens the lid of the dumpster and a fan, powered by a DC motor, blows fake flames upwards. A Circuit Playground Express, programmed with MakeCode, controls the motors and illumination.

This project can be easily reprogrammed in MakeCode to take on different functions. A great beginner project, no soldering required!
Parts

Circuit Playground Express
Circuit Playground Express is the next step towards a perfect introduction to electronics and programming. We've taken the original Circuit Playground Classic and...

DC Motor Plastic Mount - 130 Size / 20mm Diameter
We couldn't let the DC Gearbox "TT" motors have all the fun! If you're using some sort of motor, there's a...
https://www.adafruit.com/product/3843
Sub-micro Servo - SG51R
This is just about the cutest, tiniest little micro servo we could find, even smaller than the 9-gram micro servos we love so much. It can rotate approximately 180 degrees (90 in... https://www.adafruit.com/product/2201

USB cable - USB A to Micro-B
This here is your standard A to micro-B USB cable, for USB 1.1 or 2.0. Perfect for connecting a PC to your Metro, Feather, Raspberry Pi or other dev-board or... https://www.adafruit.com/product/592

3-Bladed Trifoil Propeller Fan for DC Motor
Sprockets, wheels, and gears, oh my! We really like our DC hobby motors but unless you have a 3D printer it can be a challenge to get fun add-ons. That's why... https://www.adafruit.com/product/3896

Small Alligator Clip to Male Jumper Wire Bundle - 6 Pieces
When working with unusual non-header-friendly surfaces, these handy cables will be your best friends! No longer will you have long, cumbersome strands of alligator clips. These... https://www.adafruit.com/product/3448
Additional Materials

In addition to the electronics, for this project you will also need:

- Tissue paper
- Markers and/or highlighters (red/orange/yellow preferred)
- Hot glue gun (https://adafruit.com/EM1)
- Scissors
- Wooden skewers
- Access to a 3D printer

Read on to learn how to build your own!

Circuit Diagram

The circuit for this project connects two motors, one DC and one servo, to the Circuit Playground Express board using alligator clips.

The DC motor will begin running as soon as power to the board is turned on. This motor can be connected to either the Vout or the 3.3V pads on CPX board.
Power Options

Circuit Playground Express can use a variety of power sources, anywhere between 3V-5V is safe. This compact 2000mAh lithium ion battery (https://adafru.it/C8U) is excellent for powering projects like this.

A set of 3 AAA batteries (https://adafru.it/Ahk) also provides ample power, if that option is more convenient. If you're using a AAAx3 battery pack (https://adafru.it/dYF), check that the switch on the battery pack is set to "ON".

Adafruit Micro Lipo - USB Lilon/LiPoly charger
Oh so adorable, this is the tiniest little lipo charger, so handy you can keep it any project box! Its also easy to use. Simply plug in the gold plated contacts into any USB port and a...

https://www.adafruit.com/product/1304
Lithium Ion Battery - 3.7v 2000mAh
Lithium-ion polymer (also known as 'lipo' or 'lipoly') batteries are thin, light, and powerful. The output ranges from 4.2V when completely charged to 3.7V. This...

MakeCode

Getting Familiar

Microsoft MakeCode for Adafruit is a web-based code editor that provides a block editor, similar to Scratch or Code.org, and also a JavaScript editor for more advanced users.

If you'd like to learn more about MakeCode, [this guide is a good place to start](https://adafru.it/BDk).

The Code

The code is shown below. For browser viewing, you may need to enable content. For example, in Chrome, click "Show Embedded Content" as the material is fed not from Adafruit but from Microsoft's MakeCode site.

To download the code, click the download link at the bottom of the window. To edit the code in MakeCode, click the box with arrow icon in the upper right corner of the window.

How to Upload Code

To upload code to Circuit Playground Express, follow these instructions:

1) Connect your Circuit Playground Express to your computer using a known, good data+power micro USB cable and press the small reset button in the center of the board. All the LEDs will flash red briefly, then turn green. Your computer should now show a removable drive called CPLAYBOOT.
2) Click the Download button in the code window below to download the .UF2 file to your computer.

3) Now drag and drop the .UF2 file onto the CPLAYBOOT drive in your computer's file explorer or finder.

Once the file is dragged onto CPLAYBOOT, the drive will automatically eject itself (your computer may give you a "failed to eject drive correctly" error, you can ignore this). The code is now on your Circuit Playground Express and ready to run!

Note: If you get a drive named CIRCUITPY, no worries! Press the reset button twice to get a flash drive named CPLAYBOOT. The project will not run if copied onto the CIRC UITPY drive as it is for CircuitPython.

How does this work?

This code benefits from being very simple. In the on start loop, the servo is set to rotate as soon as power is turned on.

You will notice there is no instruction for closing the lid, that is accomplished by the weight of the lid -once power is turned off to the servo motor it no longer holds its position and the lid slowly falls back into place.

In the forever loop, you can see we tell the pixels to play an animation, adding a fiery effect to the flames.
Troubleshooting

Problem: My Circuit Playground Express doesn't show up as CPLAYBOOT

Solutions:

1. Be sure you have a Circuit Playground Express. The Circuit Playground Classic will not work with MakeCode.
2. If you get a drive named CIRCUITPY instead, press the reset button twice in succession to get to CPLAYBOOT.
3. Some USB cables are "charge-only" and won't pass data. Try using a different USB cable and try using a different USB port on your computer.
4. With the Circuit Playground Express plugged into your computer with a micro USB cable, click the small reset button in the center of the board. The lights should all turn green. If they don't, try double-clicking the reset button.

If things still aren't working, head over to the Intro to Circuit Playground Express guide for more suggestions.

3D Printing

The 3D files for this project can be downloaded by clicking the button below.

This design for this project is based on the Dumpster model created by Simon Kangiser.

Desktop Dumpster Fire 3D files

https://adafru.it/GnF
Printing the Dumpster

The dumpster prints in five different files, which are assembled together after printing.

The three large parts - the bin, the lids, and the hinge, will take the longest to print. Everything is sized so that it should press-fit together snugly.

The wheels and bar are optional, as the wheels can be replaced with [little rubber bumper feet](https://adafru.it/dLG), and the bar that hold the lids to the hinge can be replaced with a straightened out paper clip or something similar if you'd prefer not to print those parts.
Create Dumpster Fire

Flames
Using thin tissue paper (so it will blow easily by the fan), create flame-like patterns using a combination of red, orange, and yellow markers and/or highlighters.

Cut an approximately 4-inch length of wooden skewer or dowel.

Glue flames to this section of skewer, leaving a short length of the skewer extending off to the right.
A short length of string (floss also works fine) can be used to yank the flames vertical when the dumpster lid opens.

Tie a knot in one end and, after passing the string through the center of the flames, use a dab of hot glue to affix the other end to the underside of the dumpster lid.

**Lid-Opener**

Attach a short extension made from a wooden skewer or something similar to the servo arm.

Press the servo arm onto the servo motor and check that its range of motion will allow the dumpster lid to open fully.

Use a thin strip of cardboard to keep the dumpster lid connected to the servo arm.
Wind Power

You may need to shave down the ends of the propellor for it to spin freely inside the dumpster bin.

Place the motor inside the dumpster and stick it in place using a small piece of double sided foam tape or a dab of hot glue.

Your wiring and electronics should fit neatly inside the dumpster, with the battery cable extending out the back.

When the lid on the right is lowered, the flames should be positioned right above the fan.
Poke the pushbutton switch from the battery cable out from under the front of the dumpster to create an easy on-off switch for your dumpster fire.
