

# IoT Temperature Logger with Analog Devices ADT7410, Raspberry Pi, and Adafruit IO

Created by Brent Rubell

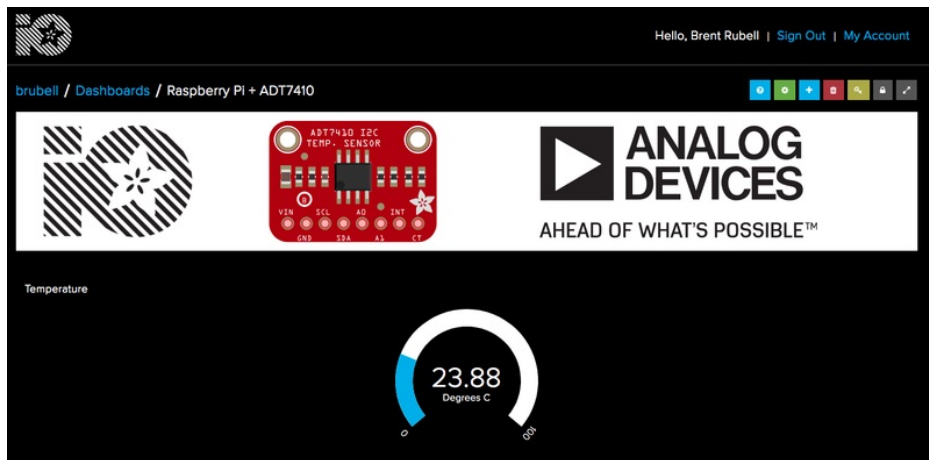

Last updated on 2019-04-04 07:08:03 PM UTC

## Overview

Analog Devices, known for their reliable and well-documented sensor chips - has a high precision and high resolution temperature sensor on the market, and we've got a breakout to make it easy to use! The **Analog Devices ADT7410** gets straight to the point - it's an I2C temperature sensor, with 16-bit 0.0078°C temperature resolution and 0.5°C temperature tolerance. Wire it up to your microcontroller or single-board computer to get reliable temperature readings with ease

This sensor can be put *online* using a Raspberry Pi, Python, and Adafruit IO. You'll be up and running in under 15 minutes!

If you're looking for a way to precisely monitor and log temperature data to the cloud, follow along!

Thanks to Digi-Key (<https://adafru.it/BJr>) and Analog Devices (<https://adafru.it/DPF>) for sponsoring the development of this guide - Adafruit has made the ADT7410 PCB "Digi-Key red" (<https://adafru.it/BJr>) in their honor!

## Parts

ADT7410 High Accuracy I2C Temperature Sensor Breakout Board

\$5.95  
IN STOCK

ADD TO CART

Raspberry Pi 3 - Model B+ - 1.4GHz Cortex-A53 with 1GB RAM

\$35.00  
IN STOCK

ADD TO CART

Monochrome 128x32 I2C OLED graphic display

\$17.50  
IN STOCK

ADD TO CART

Assembled Pi T-Cobbler Plus - GPIO Breakout

\$7.95  
IN STOCK

ADD TO CART

## Materials

You'll need the materials below to complete this project. If you do not have them, pick them up from the Adafruit Store.

---

### 1 x [Breadboard](#)

Half-size breadboard

[ADD TO CART](#)

---

### 1 x [Adafruit Pi Dish](#)

Adafruit Pi Dish for Raspberry Pi - Includes Breadboard

[ADD TO CART](#)

---

### 1 x [Wire Bundle](#)

Breadboarding wire bundle

[ADD TO CART](#)

---

### 1 x [16GB MicroSD Card](#)

16GB Card with NOOBS 2.9

[OUT OF STOCK](#)

---

### 1 x [MicroUSB 5V 2.5A Power Supply](#)

5V 2.5A Switching Power Supply with 20AWG MicroUSB Cable

[ADD TO CART](#)

---

## Adafruit IO Setup

### Feed Setup

If you do not already have an Adafruit IO account set up, head over to [io.adafruit.com](https://io.adafruit.com) (<https://adafru.it/fH9>) to link your Adafruit.com account to Adafruit IO.

The first step is to create a new Adafruit IO feed to hold the AD7410's temperature. Navigate to the [feeds page](https://adafru.it/mxC) (<https://adafru.it/mxC>) on Adafruit IO. Then click **Actions** -> **Create New Feed**, and name this feed **temperature**.

- If you do not already know how to create a feed, head over to [Adafruit IO Basics: Feeds](https://adafru.it/ioA) (<https://adafru.it/ioA>).

### Create a new Feed ✕

Name

Description

Add to groups

Cancel

Create

### Dashboard Setup

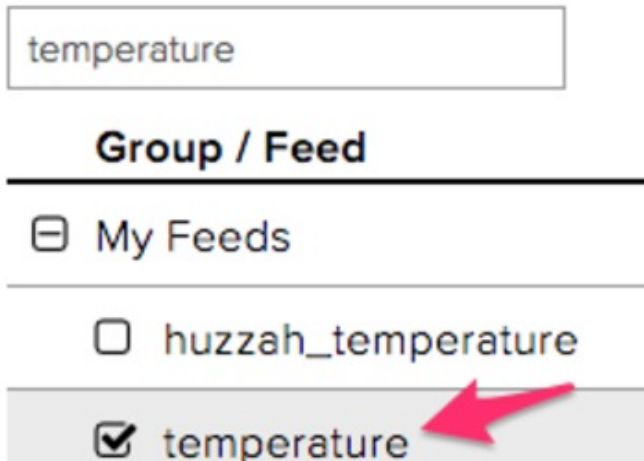

Next, step is to create a dashboard to display the value read by the ADT7410 sensor.

- If you do not know how to create or use Dashboards in Adafruit IO, head over to the [Adafruit IO Basics: Dashboards](https://adafru.it/f5m) (<https://adafru.it/f5m>) guide.

Select the Gauge block.

Select the *temperature* feed created earlier.

In the Block Settings step, set the **Block Title to Temperature**, set the **Gauge Min/Max Values to the upper and lower temperature thresholds** you want to measure.

You can label the gauge by setting the **Gauge Label** - this example assumes temperature is to be measured in **Degrees C**.

*Uncomfortably hot/cold?* You can optionally set the gauge change color to warn you if the temperature goes above (or below) a certain value.

After adding the gauge element, your dashboard will look like the following:

You are also going to need your Adafruit IO username and secret API key.

Navigate to your profile and click the **View AIO Key** button to retrieve them. Write them down in a safe place, you'll need them for later.

## Wiring

Need a way to connect your Raspberry Pi to a breadboard? Check out the T-Cobbler Plus - this add-on prototyping board lets you easily connect a Raspberry Pi (Raspberry Pi Model Zero, A+, B+, Pi 2, Pi 3) to a solderless breadboard:

Assembled Pi T-Cobbler Plus - GPIO Breakout

\$7.95  
IN STOCK

ADD TO CART

The ADT7410 and the 128x32 OLED each have a unique address and can be connected together as i2c devices, using the Raspberry Pi as a i2c controller ([For more information about i2c addressing, check out the guide here...](https://adafru.it/BK0) (<https://adafru.it/BK0>))

Make the following connections **between the Pi and the ADT7410**:

- Pi 3.3V to ADT7410 VIN
- Pi GND to ADT7410 GND
- Pi SCL to ADT7410 SCL
- Pi SDA to ADT7410 SDA

Make the following connections **between the Pi and the OLED Display**:

- Pi SCL to Display SCL
- Pi SDA to Display SDA
- Pi GPIO #21 to Display RST
- Pi 3.3V to Display VIN
- Pi GND to Display GND

## Python Code

This guide assumes that you've gotten your Raspberry Pi up and running, and have CircuitPython installed.

- If you have not done this yet, visit the installation guide [here](https://adafru.it/Deo) and come back when you're set up. (<https://adafru.it/Deo>)

## Installing Fonts

This project uses a Microsoft TrueType Font. To install it, enter the following into the terminal on your Raspberry Pi:

```
sudo apt-get install ttf-mscorefonts-installer
```

## Installing CircuitPython Libraries

Since CircuitPython is running on the Raspberry Pi - installing the libraries for this guide is quick and easy.

To [install the library for the display](https://adafru.it/u1f) (<https://adafru.it/u1f>), enter the following into the terminal

```
sudo pip3 install adafruit-circuitpython-ssd1306
```

You'll also need to [install the CircuitPython library to read data from the Analog Devices ADT7410](https://adafru.it/DPz) (<https://adafru.it/DPz>):

```
sudo pip3 install adafruit-circuitpython-adt7410
```

The code for this project is below. Save it to the Raspberry Pi as `adafruit_io_adt7410.py`

```
"""
'adafruit_io_adt7410.py'
=====
Example of sending temperature
values to an Adafruit IO feed using
an ADT7410 breakout.

Dependencies:
- Adafruit_Blinka
  (https://github.com/adafruit/Adafruit_Blinka)
- Adafruit_CircuitPython_SSD1306
  (https://github.com/adafruit/Adafruit_CircuitPython_SSD1306)
- Adafruit_CircuitPython_ADT7410
  (https://github.com/adafruit/Adafruit_CircuitPython_ADT7410)
"""
# Import standard python modules
import time

# import Adafruit SSD1306 OLED
from PIL import Image, ImageDraw, ImageFont
import adafruit_ssd1306

# import Adafruit IO REST client
from Adafruit_IO import Client

# import Adafruit CircuitPython adafruit_adt7410 library
import adafruit_adt7410
```

```

# import Adafruit Blinka
import board
import busio
import digitalio

# Delay between sensor reads, in seconds
DELAY_SECONDS = 30

# Set to your Adafruit IO key.
# Remember, your key is a secret,
# so make sure not to publish it when you publish this code!
ADAFRUIT_IO_KEY = 'ADAFRUIT_IO_KEY'

# Set to your Adafruit IO username.
# (go to https://accounts.adafruit.com to find your username)
ADAFRUIT_IO_USERNAME = 'ADAFRUIT_IO_USERNAME'

# Create an instance of the REST client
aio = Client(ADAFRUIT_IO_USERNAME, ADAFRUIT_IO_KEY)

# Set up `temperature` feed
pi_temperature = aio.feeds('temperature')

# Set up OLED
i2c_bus = busio.I2C(board.SCL, board.SDA)
oled_reset = digitalio.DigitalInOut(board.D21)
disp = adafruit_ssd1306.SSD1306_I2C(128, 32, i2c_bus, reset=oled_reset)
# Clear display.
disp.fill(0)
disp.show()

# Create blank image for drawing.
# Make sure to create image with mode '1' for 1-bit color.
width = disp.width
height = disp.height
image = Image.new('1', (width, height))
# Get drawing object to draw on image.
draw = ImageDraw.Draw(image)
# `sudo apt-get install ttf-mscorefonts-installer` to get these fonts
font_big = ImageFont.truetype('/usr/share/fonts/truetype/msttcorefonts/Arial_Bold.ttf', 16)
font_small = ImageFont.truetype('/usr/share/fonts/truetype/msttcorefonts/Arial_Bold.ttf', 12)

adt = adafruit_adt7410.ADT7410(i2c_bus, address=0x48)
adt.high_resolution = True
time.sleep(0.25) # wait for sensor to boot up and get first reading

while True:
    # clear screen
    draw.rectangle((0, 0, width, height), outline=0, fill=0)

    # Read the temperature sensor
    tempC = adt.temperature
    tempC = round(tempC, 2)

    # display the temperature on the OLED
    draw.text((0, 0), "Temp: %0.2F *C" % tempC, font=font_big, fill=255)

    # Send temperature to Adafruit IO
    print('Sending temperature {0} C to Adafruit IO'.format(tempC))
    draw.text((0, 16), "Sending ..." font=font_small fill=255)

```

```

draw.text((0, 16), "Sending...Done!", font=font_small, fill=255)
disp.image(image)
disp.show()

aio.send(pi_temperature.key, tempC)
draw.text((0, 16), "Sending...Done!", font=font_small, fill=255)
disp.image(image)
disp.show()

# Delay for DELAY_SECONDS seconds to avoid timeout from adafruit io
time.sleep(DELAY_SECONDS)

```

Before running the code, you'll need to set the **ADAFRUIT\_IO\_KEY** to the Adafruit IO Key we saved earlier and set the **ADAFRUIT\_IO\_USERNAME** to your Adafruit IO Username.

When both of these variables are changed, save the file. You can run the program by entering the following in your terminal:

```
python adafruit_io_adt7410.py
```

and Press the Enter Key.

You should see the following print out in your terminal

```

Sending temperature 22.26 C to Adafruit IO
Sending temperature 22.27 C to Adafruit IO
Sending temperature 22.25 C to Adafruit IO
Sending temperature 22.27 C to Adafruit IO
Sending temperature 22.28 C to Adafruit IO

```

The display should display the temperature read from the ADT7410 along with the status of the data being sent to Adafruit IO.

```
Live Data newest data at the top
2019/02/11 1:20pm temperature 22.35
2019/02/11 1:19pm temperature 22.3
2019/02/11 1:19pm temperature 22.3
2019/02/11 1:18pm temperature 22.28
2019/02/11 1:18pm temperature 22.27
```

Next, we're going to check that the data has been received by Adafruit IO. We can do this by visiting the [Adafruit IO Monitor page \(https://adafru.it/DOK\)](https://adafru.it/DOK). Every 30 seconds, the page will refresh with the latest values from the ADT7410.

If you want to change the delay, change the variable `DELAY_SECONDS` to the desired delay between sensor reads.

Navigate to the dashboard you created earlier to view the temperature gauge we added. Every 30 seconds, it'll update and display a new value.

For more information about the ADT7410 CircuitPython library, [check out the latest docs! \(https://adafru.it/DPD\)](https://adafru.it/DPD)
