Overview

While there are plenty of animated gif players, none of them allow you to control the animated gifs like a slide show. This guide will show you how to build 2 different Animated Gif Players that allow you to control the speed and direction with a rotary encoder based on the hardware you have available. Build one yourself and join the Rotary Gif club!

In the first one, the Mini PiTFT Player, is an Animated Gif Player that is similar to the Gif Player in the PiTFT Python + Pillow Animated Gif Player (https://adafruit.it/V6e) guide and is in fact based on the animated Gif player from that guide. However, the code has been modified to be controlled by a rotary encode that can be connected easily by STEMMA QT.
In the second player, the PyGame Player, is a similar player that uses the Official Raspberry Pi 7" Display and a Rotary Trinkey. This version uses PyGame to create a full-sized window on a desktop version of Raspberry Pi.

Parts

You'll need the following parts for both. Any of the Raspberry Pi 4 models should work fine.

**Raspberry Pi 4 Model B**
The Raspberry Pi 4 Model B is the newest Raspberry Pi computer made, and the Pi Foundation knows you can always make a good thing better! And what could make the Pi 4 better...
https://www.adafruit.com/product/4297

**Rotary Encoder + Extras**
This rotary encoder is the best of the best, it's a high-quality 24-pulse encoder, with detents and a nice feel. It is panel mountable for placement in a box, or you can plug it...

Smart Pi Touch Pro for Raspberry Pi and
Official 7" Display
Here is an updated, excellently designed stand that provides a sleek and sturdy look for the 7" Touchscreen...
https://www.adafruit.com/product/4951

Because the Smarti Pi display orients the Trinkey with the knob in the rear, you may want to also pick up a short USB extension cable.
Mini PiTFT Player

Wiring

It's easy to connect everything together with the Mini PiTFT player. First connect the display to the Raspberry Pi:

Then just connect a STEMMA QT Rotary Encoded up the the STEMMA QT Connector on the Mini PiTFT.

Setup

You will want to start by installing the latest version of the Raspberry Pi Lite onto an SD card. You can refer to the CircuitPython on Linux and Raspberry Pi (https://adafru.it/BSN) guide for more help setting it up.

Once you have everything set up, you will need to open a terminal and install Blinka. Refer to the Installing CircuitPython Libraries on Raspberry Pi (https://adafru.it/Deo) page to quickly get up and running.
Install Required Libraries

You will need to have a few libraries installed before the script will run on your computer.

Install the required CircuitPython libraries:

```bash
pip3 install adafruit-circuitpython-rgb-display
pip3 install adafruit-circuitpython-seesaw
pip3 install --upgrade --force-reinstall spidev
```

Also, install NumPy since it will speed up the RGB Display library:

```bash
pip3 install numpy
```

DejaVu TTF Font

Raspberry Pi usually comes with the DejaVu font already installed, but in case it didn't, you can run the following to install it:

```bash
sudo apt-get install ttf-dejavu
```

Pillow Library

We also need PIL, the Python Imaging Library, to allow graphics and using text with custom fonts. There are several system libraries that PIL relies on, so installing via a package manager is the easiest way to bring in everything:

```bash
sudo apt-get install python3-pil
```

Download the Code

Copy mini_pitft_player.py and animatedgif.py onto the Raspberry Pi. You can download them by clicking on the Download Project Bundle below or you can use `wget` to copy them right off the web into your current folder:

```bash
```
Run the Script

Just run it using the following command:

```
python3 mini_pitft_player.py
```

Full Player Code

```python

        if auto_advance:
            self.advance()
PyGame Player

This one is a bit more complicated because it uses 2 devices running Python that need to communicate with each other through serial.

How it works

This player is in two parts. It uses a Rotary Trinkey running CircuitPython to receive the input and translate it into serial data and the second part runs on the Raspberry Pi and reads that serial data and decodes that to the original inputs and uses that to determine the when to advance the animated Gif frames. This is the same technique used in the MacroPad Remote Procedure Calls over USB to Control Home Assistant (https://adafru.it/V8E) guide.

For the Rotary Trinkey, the code is very similar to the standard example code, but with a few key differences. It will communicate using a second CDC_Data serial port so that unnecessary characters are not added to the stream by CircuitPython. It will also print out the word "click" when the button is pressed and everything is separated by commas instead of printing onto a new line.

For the Python program, it starts off by detecting the serial port that the Rotary Trinkey is connected to and initializing it with PySerial. Once it is connected, PyGame is initialized in fullscreen mode and the mouse cursor is hidden. It then preloads any Gif images found in the folder and stores them in a list. It starts off with the first image in whatever order the os module returns the files in and loads up the first one.
Once an image is loaded, it waits for data and depending on the direction you turn the knob it will either go forward or backwards in frames. A modulus operator is used to keep the current frame value within the index boundaries. Once the frame is extracted with Pillow, it is loaded into PyGame as a surface using the `blit()` command and the screen is updated with the `flip()` command.

Wiring

Wiring is super easy on this player because all you need to do is connect the Rotary Trinkey to any of the USB ports. We recommend using a USB extension if you have the Display mounted on a stand because the orientation of the Raspberry Pi causes the Trinkey to only be accessible from the rear.

If you bought the SmartPi Pro case, you can find assembly instructions on their website (https://adafruit.it/V8F).

Rotary Trinkey Setup

You'll want to put the latest version of CircuitPython onto the Rotary Trinkey first. If you're not sure how to do it, you can refer to CircuitPython installation page of the Adafruit Rotary Trinkey (https://adafruit.it/V9a) guide.

For this project, there are no libraries needed. Everything is built into CircuitPython itself.
You will need to copy both the boot.py and code.py files onto the Trinkey, in the root of the CIRCUITY drive that should show up. You can download them by clicking on the Download Project Bundle below.

```python
import usb_cdc
import rotaryio
import board
import digitalio

serial = usb_cdc.data
coder = rotaryio.IncrementalEncoder(board.ROTA, board.ROTB)
button = digitalio.DigitalInOut(board.SWITCH)
button.switch_to_input(pull=digitalio.Pull.UP)

last_position = None
button_state = False

while True:
    position = encoder.position
    if last_position is None or position != last_position:
        serial.write(bytes(str(position) + ',', 'utf-8'))
        last_position = position
    print(button.value)
    if not button.value and not button_state:
        button_state = True
    if button.value and button_state:
        serial.write(bytes('click,', 'utf-8'))
        button_state = False
```

The boot.py file has the setting sin it you need to enable the CDC Data Device. You can read more about it in our [Customizing USB Devices in CircuitPython](https://adafru.it/SC9) guide.

```python
import usb_cdc

usb_cdc.enable(console=True, data=True)
```

**Raspberry Pi Setup**

You will want to start by installing the latest version of the Raspberry Pi Desktop onto an SD card. There's a nice utility available from Raspberry Pi called the [Raspberry Pi Imager](https://adafru.it/QbQ) that makes installing images very easy. You can also refer to the [CircuitPython on Linux and Raspberry Pi](https://adafru.it/BSN) guide for more help setting it up.

Once you have everything set up, you will need to open a terminal and install Blinka. We recommend referring to the [Installing CircuitPython Libraries on Raspberry Pi](https://ps://adafru.it/Deo) page of that guide to quickly get up and running.
Install Required Libraries

You will need to have a few libraries installed before the script will run on your computer.

**Install Adafruit_Board_Toolkit:**

```
pip3 install adafruit-board-toolkit
```

**Install PySerial next:**

```
pip3 install pyserial
```

**Install PyGame next:**

```
pip3 install pygame
```

**DejaVu TTF Font**

Raspberry Pi usually comes with the DejaVu font already installed, but in case it didn’t, you can run the following to install it:

```
sudo apt-get install fonts-dejavu
```

This package was previously called ttf-dejavu, so if you are running an older version of Raspberry Pi OS, it may be called that.

**Pillow Library**

We also need PIL, the Python Imaging Library, to allow graphics and using text with custom fonts. There are several system libraries that PIL relies on, so installing via a package manager is the easiest way to bring in everything:

```
sudo apt-get install python3-pil
```
Download the Code

Copy pygame_player.py and animatedgif.py onto the Raspberry Pi. You can either copy them out of the bundle that you downloaded in the Rotary Trinkey Setup step or you can use `wget` to copy them right off the web into your current folder:

```
```

Run the Script

The code must be run from a terminal window on the Pi itself and not from an SSH session. This is because PyGame will try and create a window on the current device you are typing from. Just run it using the following command:

```
python3 pygame_player.py
```

Full Player Code

```python
# This example is for use on (Linux) computers that are using CPython with Adafruit Blinka to support CircuitPython libraries. CircuitPython does not support PIL/pillow (python imaging library)!

Using the Player

Adding Animated Gifs

You can find animated Gifs all over the internet. A great website for finding a large collection of them is giphy.com (https://adafru.it/GeU). Once you find them, you'll need to get them over to your Raspberry Pi. The easiest way would be to just use FTP or downloading them directly from the internet on your Pi if that's what you would prefer. Just make sure they're in the same folder as the script.

The default folder used in the test scripts is an images subfolder inside of the folder the script is in. If you are using something different, be sure to change it at the bottom of the script.

Scrolling and Navigating through Animated Gifs

Just rotate the knob clockwise to start scrolling through the frames of the current Gif. If you turn the knob fast, it will move faster and turning it slowly will make it advance frames at a slower rate.

For the Mini PiTFT Player it seems turning the knob too fast will make the animation slow down a bit because it takes more processing power to pipe the data out to the TFT display and it can't read the rotary encoder quite as often.

To load the next animated Gif, just click the knob inward. When it gets to the end, it will load the first Gif.
Exiting the Player

On the PyGame Player, just hit ESC on the keyboard to exit. For the Mini PiTFT Player, you can just hit Control+C to exit.

Some Modifications to Try

There is some room for modification in the code. For instance in either player, you can change `include_delays= False` to `include_delays=True` and then it will include the built-in delays that are part of the animated Gif file.

Another modification that could be made for the PyGame Player takes advantage of the touch sensor on the Rotary Trinkey and uses that to send a quit command to close the application.

For the Mini PiTFT Player you can have it jump a certain number of frames based on the rotary increase on the knob. This may have the effect of the animated gif skipping around though. Have fun with it and see what you can get it to do.
